University of Pavia – Department of Electrical, Computer and Biomedical Engineering

Main Topics Covered

- The course covered the following **major** topics:
  - main attack surfaces and threat models
  - evolution from weaknesses to vulnerabilities
  - architecture of malware and basic analysis techniques
  - signatures, YARA rules and main evasion mechanisms
  - the importance of the software supply chain
  - tools for computing SBOMs and identify vulnerable packages
  - network security principles, primarily to outline attack entry points
  - a quick journey to advanced offensive templates like covert channels.
- This topics are **practical building blocks** that:
  - **you are expected to encounter during your work as an engineer**
  - are often part of your daily routine.

What You Got: Technical Skills

- Some technical skills you have acquired:
  - **ability to analyze software**: navigate vulnerability databases, understand security bulletins, be aware of risks
  - **outline security perimeters**: inspect a software or a service, use basic security assessment tools, perform basic scanning operations
  - **comprehend offensive techniques**: knowledge of static/dynamic analysis methods to study a menace, understand obfuscation, distill signatures and apply rules
  - **retrieve tools**: awareness of the vast ecosystems of software and languages that can support your daily cybersecurity routine.

Source: r/funny

What You Got: Soft Skills

- Some soft skills you should own:
  - be conscious of how an attacker **thinks**
  - the ability of decomposing complex offensive campaigns or threats in **baby steps**
  - feel the urge of being a **better engineer** when handling sensitive data or developing hardware and software components.
- The course scratched the surface, but:
  - you can analyze systems with a **security-first** mindset
  - you have **pointers** to modern security concepts
  - you briefly saw some **advanced offensive techniques**
  - you have the **foundations** to **learn by your own**.

Next Steps

- What happens now:
  - stay **updated** with emerging threats and new tools
  - **practice** on real platforms or learn on real settings
  - engage with the open-source community: **try** and **help**
  - do a **thesis** on cybersecurity topics.
- Develop a path towards a **career** on:
  - vulnerability assessment
  - incident response
  - network security roles
  - secure software development
  - cloud security
  - pentesting
