

Digital Animation

Animated GIFs...

Sequences of GIF images

- Each frame is an ordinary GIF image
- Problem: if there are many frames, the files are big

Sequences are properly timed

Slow animations, fast animations, ...

... animated GIFs

Tweening

Automatically creates a series of frames between two existing *keyframes*, gradually varying some attributes

E.g., position, opacity, and other parameters

Example:

History - Adobe Flash

Allowed to create sophisticated animations

The behaviors of “objects” could be programmed through the *ActionScript* language

Until few years ago, Flash was the *de facto* standard for web animations

Vector animations

Adobe Animate

Allows web designers to create interactive HTML5 animations for the Web, digital publishing, rich media advertising, etc.

Vector animations

Google Web Designer (free)

Allows the creation of relatively simple HTML5 animations and interactive elements

Typical vector tools...

Drawing tools

Similar to the tools of Photoshop or GIMP, but focused on vector graphics

- Selection tools
 - To select objects
- Tools to draw lines and regular shapes
- Tools to color uniform areas
- Tools to modify/process shapes
 - Fully configurable

... typical vector tools ...

The shape of objects can be easily modified

- Relatively little effort to create complex drawings
- Each line/object can be selected/altered

... typical vector tools ...

Animations can be created exploiting different *layers* on a *timeline*

... typical vector tools

Tweening

Given some *keyframes* in the timeline, intermediate frames can be generated automatically
