

Application Servers (examples)

PHP (Hypertext Preprocessor)

Server-side scripting language (free)

Initially created for Unix-Linux environments, but now also widespread on Microsoft Windows servers

Example

```
<html>
  <head>
    <title>A PHP simple example</title>
    <?php
      // some variables
      $bgcolor = "green";
      $textcolor = "white";
    ?>
  </head>
  <body <?php echo "style='background: $bgcolor; color: $textcolor'"; ?>>
    <h1>A PHP page!</h1>
  </body>
</html>
```

ASP (Active Server Pages)

Server-side scripting language (Microsoft, free)

- Normally based on the Microsoft *VBScript* language
- *ASP.NET* is an evolution of ASP (generally based on C#)

Example

```
<html>
  <head><title>ASP simple example</title></head>
  <body>
    <p>Hello everybody, Time: <%= Time %></p>
    <% strCompany = "My company"
       strLogo = "mylogo"
       Response.Write "<p>" & strCompany & " " <img src='/logos/" & strLogo & ".gif'"></p>"
    %>
  </body>
</html>
```

ColdFusion

Server-side tag-based language

- Does not necessarily require programming skills
- Not free (initially created by *Allaire*, then acquired by *Macromedia*, and then by *Adobe*)

Example

```
<html>
  <head>
    <title>A simple ColdFusion example</title>
  </head>
  <body>
    <cfoutput>
      Hello,<br> your IP address is: <em>#REMOTE_ADDR#</em>,<br>
      and your browser is: <em>#HTTP_USER_AGENT#</em>.<br />
      Today is: <em>#DateFormat(Now(), "DDDD, MMMM DD, YYYY")#</em>
    </cfoutput>
  </body>
</html>
```

JSP (Java Server Pages)

Application server based on Java

Example:

```
<html>
  <head><title>First JSP</title></head>
  <body>
    <%double num = Math.random();
      if (num > 0.95) {
        %>
          <h1>You'll have a lucky day!</h1><p>(your score: <%= num %>)</p>
        <%
          } else {
            %>
              <h1>Well, life goes on... </h1><p>(your score: <%= num %>)</p>
            <%
              }
            %>
          <a href="<%= request.getRequestURI() %>"><h2>Try Again</h2></a>
        </body>
  </html>
```
